DartZoom – Step-by-Step Integration Guide for OBS

Thank you for purchasing the DartZoom plugin from FollowDarts and for supporting FollowDarts. This guide will walk you step by step through the complete setup process to successfully integrate DartZoom into OBS and turn your dart stream into a unique experience for your viewers.

1. Requirements

To use DartZoom, you need OBS Studio and the OBS Move Transition plugin. You can find the download link to the Move Transition plugin in the readme file. Download it and run the Windows Installer.exe. The plugin will be installed automatically into OBS.

2. Create the Board Scene

Open OBS and create a new scene called Board. In this scene, add your board camera. Crop the image by holding the Alt key and adjust the board so that it is perfectly aligned in the frame.

3. Add the Board to Your Main Scene

Switch to your main scene, which is the scene you use for streaming. Add the Board scene as a source to your main scene.

4. Install the DartZoom Browser Extension

Open Chrome or your preferred browser and go to the extensions page. Enable Developer Mode in the top right corner. Click on Load unpacked extension and select the unpacked DartZoom folder, which should be located on your desktop. The extension is now installed.

5. Connect DartZoom to OBS

Open the DartZoom extension using the icon in the top right corner. If there is no connection to OBS yet, open OBS, click on Tools, then on WebSocket Server Settings. Enable the WebSocket server, disable authentication, click Apply, and then click OK. When you open the extension again, the connection to OBS should be established.

6. Basic Settings in DartZoom

Enter your AutoDarts username, select your main scene, select your board scene, and set the default filter. Then click on Create All Cam Filters.

7. Configure the Filters in OBS

Go back to OBS, right-click on your board source, and open the filters. You will see that all required filters have been created automatically. Select the default filter and make sure you are in your board scene.

8. Set the Default Transform

In the board scene, select the default filter, scroll down, click on Transform, and then click Get Transform. This is now your default board view.

9. Set the Zoom Positions

Select for example the Single 1 filter, zoom the board to the single 1 field, and click Get Transform again. Switching between Default and Single 1 will now show the zoom animation. Repeat this process for all other fields such as Single 2, Triple, Double, and Bull.

10. Test in the Main Scene

Switch back to your main scene and check if all zoom animations are working correctly.

11. DartZoom Extension Settings

Open the DartZoom extension again. Here you can set the score at which the checkout zoom should activate, for example only at 60 or below. You can also configure sounds for zoom in and for returning to the default view by entering the file name of the sound file used in OBS. Additionally, you can configure automations for first throw, game end, or player change.

12. Finish

Start an AutoDarts match and enjoy your fully automatic DartZoom experience.
